EDUCATION

Universidad Autónoma de Baja California (UABC), Tijuana, Mexico — Expected graduation: **12/27**
B.S. in Software Engineering and Emerging Technologies · GPA: 89.6/100
Relevant coursework: Human-Computer Interaction, Requirements Engineering, Software Analysis & Design.

SKILLS

Design: Figma (prototyping, components, Figma Make), wireframes, mockups, storyboards, design systems, pixel-art animation (Aseprite)
UX research: moderated usability testing (think-aloud), SUS, hierarchical task analysis, heuristic evaluation
Front end & code: HTML/CSS, JavaScript/TypeScript, React, Next.js, Flutter/Dart, Python, Java, Firebase, Git
Languages: Spanish (native), English (fluent)

DESIGN PROJECTS

8=1 UABC: Student mobile app | Figma, Flutter — Aug 2026 – Present
- Designed the mobile app for UABC's 8=1 program (8 activities attended = 1 elective credit): onboarding, event calendar, QR check-in, history and profile.
- Put credit progress (5/8) on the home screen and made check-in the one primary action, with a manual-code fallback for virtual events and failed cameras.
- Building the app in Flutter within a 5-person team (teammates build the admin web portal and API), implementing the new design with a shared theme and widget library before connecting it to the API.

Laminar: Visual Git client for students (solo) | Figma, React, Python/PyQt — Oct 2025 – Dec 2025
- Designed a desktop app that lets engineering students version projects without the command line, iterating 5 core screens from wireframes to high fidelity.
- Gathered feedback on the concept and ease of use from classmates in informal sessions.
- Built it end to end: React front end generated with Figma Make, Python/PyQt back end running Git, and live progress feedback during sync.

Catálogo Cimarrón: Library catalog redesign (team of 2) | Figma, usability testing — Aug 2025 – Dec 2025
- Mapped how students find a book with task analysis and storyboards, then prototyped a new catalog in Figma.
- Ran moderated think-aloud tests with 2 students (6 tasks) and a SUS survey: 100% task success, SUS score 88.75.
- Found a critical issue the scores missed: students had no way to reserve an available book. Ranked 4 issues by severity and proposed fixes.

EasyReq: AI-assisted requirements web app (team of 6) | Next.js, Firebase — Jan 2026 – Present
- Led the UI redesign and built the shared modal, confirmation and error components used across the app.
- Merged team details and member editing into one screen instead of two flows, and added a help page and guided password recovery.

OTHER PROJECTS

MonitorUABC: Real-time service monitoring | Python, JavaScript, Firebase — May 2026 – Aug 2026
- Co-built a client-server dashboard for university services, adding centralized caching to avoid overloading institutional servers.

Unlikely Rivals: 2D fighting game | C++, SFML, Aseprite — Jun 2025 – Sep 2025
- Built the game in C++ and drew and animated its pixel-art sprite sheets, using state machines to blend between moves.
